Proving circuits with linear commitments

Goal: prove knowledge of x such that C(x) = z

- Commit to extended witness \vec{w} >inputs, + output wire of every mult.
- Evaluate linear gates
 ➤Using linear homomorphism

[Cramer-Damgård 97]

Prove correctness of multiplications

Proving circuits with linear commitments

Prove correctness of multiplications

Common input: C and **x**, which defines $W_d : \{0, 1\}^{s_d} \to \mathbb{F}$

- ① P sends $\mathbf{y} = C(\mathbf{x})$, which defines $W_0^* : \{0,1\}^{s_0} \to \mathbb{F}$
- 2 V chooses $r \leftarrow \mathbb{F}^{s_0}$, sends r to P, and sets $H_0 := \widetilde{W}_0^*(r)$

3 P, V run the sum-check protocol to show $H_0 = \sum_{b,c} \tilde{p}_1(r, b, c)$

Intuition:

- Let W_0 be the function corresponding to the correct output
- If $W_0^* \neq W_0$, then $W_0^*(r) \neq W_0(r)$ w.h.p.
- If $W_0^*(r) \neq W_0(r)$, V will reject in the sum-check protocol w.h.p.

Layer-by-layer to the Rescue!

www.sjtu.edu.cn

IP + Linear Com -> ZKP [Cramer-Damgård 97]

Combine linear-time GKR (Libra [XZZ+19], [ZLW+21]) with VOLE-based commitments.

Construction & Intuition:

1. Prover runs GKR-Prover except that all messages are committed by VOLE

2. Verifier checks whether a GKR verifier will accept the "proof"

Recall that the GKR verifier only checks degree-2 relations! Equivalent to multiplication check!

IP + Linear Com -> ZKP [Cramer-Damgård 97]

Combine linear-time GKR (Libra [XZZ+19], [ZLW+21]) with VOLE-based commitments.

Construction & Intuition:

1. Prover runs GKR-Prover except that all messages are committed by VOLE

2. Verifier checks whether a GKR verifier will accept the "proof"

In particular, we can extend GKR to Z_{2k} and incorporate it with MozZarella's commitment for Z_{2k} .

Hence, we obtain ZK for Z_{2k} with *linear time prover* and *sublinear proof size*.

饮水思源 爱国荣校

Completeness is clear...

Analysis of sum-check protocol

Theorem

Let p be an n-variate polynomial of degree d_i in each variable. Then the sum-check protocol has soundness error $\leq \sum_i d_i / |\mathbf{F}|$.

Proof.

By induction on n...

- Inductive step: Say $H_0 \neq \sum_{x_1 \in \{0,1\}} \cdots \sum_{x_n \in \{0,1\}} p(x_1, \dots, x_n)$. Let $p_1^*(x_1) = \sum_{x_2 \in \{0,1\}} \cdots \sum_{x_n \in \{0,1\}} p(x_1, \dots, x_n)$ and $p(x_1, \dots, x_n)$.
 - If $p_1 = p_1^*$, then $p_1(0) + p_1(1) \neq H_0$ and V rejects
 - If $p_1 \neq p_1^*$, then $\Pr_{r_1}[p_1(r_1) \neq p_1^*(r_1)] \geq 1 d_1/|\mathbb{F}|$
 - When that is the case, $H_1 \neq \sum_{x_2 \in \{0,1\}} \cdots \sum_{x_n \in \{0,1\}} p(r_1, x_2, \dots, x_n)$ and we can apply the induction hypothesis

Linearly homomorphic commitment from VOLE:

MAC tags \mathbf{M}_{x} and values \mathbf{x} [X] MAC keys \mathbf{K}_{x} and global key Δ

cf. Wolverine [WYKW21] for fields, MozZarella [BBMS22] for rings

Gate-by-gate flavor of classical VOLE-based ZK:

"Commit-and-prove" paradigm: Prover first commits all intermediate wire values via VOLE, then proves to Verifier values underneath the commitments satisfy the circuit topology.

Protocols vary in designing CheckZero, Open, CheckMultiplication. Most techniques are distilled from MPC literature.

Appealing features of VOLE-based ZK:

Fast proving Small memory F_2/Z_{2k} -friendly Other typical properties:

Plausibly post-quantum

UC-security

Interactive

Designated-verifier from a PCG-setup

Publicly verifiable via VOLEitH

Linear proof size Sublinear

while maintain most of good properties

Downsides:

Efficiency Metrics	QuickSilver [YSWW21]	AntMan [WYY+22]	This work [LXY24]				
P Comp.	linear	quasilinear 🔅	linear 💮				
P/V Mem.	small, streaming	larger, streaming	larger				
Comm.	linear	sublinear 💮	sublinear 💮				
V Comp.	linear	linear, but larger	linear, slightly larger				
Interaction	interactive	interactive	interactive				

Our Approach: Combine linear-time GKR (Libra [XZZ+19], [ZLW+21]) with VOLE-based commitments, thus inherit a layer-by-layer flavor.

Efficiency Metrics	QuickSilver [YSWW21]	AntMan [WYY+22]	This work [LXY24]				
P Comp.	linear	quasilinear 🔅	linear 💮				
P/V Mem.	small, streaming	larger, streaming	larger				
Comm.	linear	sublinear 💮	sublinear 💮				
V Comp.	linear	linear, but larger	linear, slightly larger				
Interaction	interactive	interactive	interactive				

In particular, we also extend GKR to Z_{2k} and incorporate it with MozZarella's commitment for Z_{2k} .

Hence, we obtain ZK for Z_{2k} with *linear time prover* and *sublinear proof size*.

Threshold Ring Signatures for Large Rings from VOLE-in-the-Head and Approximate Lower Bound Arguments

Figure: Ring of n users

◆□▶ ◆□▶ ◆□▶ ◆□▶

æ

Figure: Ring of *n* users, with threshold 3

ヘロト 人間 とくほとう ほとう

æ

Construct a *t*-out-of-*n* threshold ring signature from OWF + ZK

Each user has their own (pk, sk) = ((x, y), k) such that $E_k(x) = y$ pair for signing

Each signing member in the ring contribute with a partial signature

- No signer can contribute twice, due to collision-resistance of a deterministic substring (referred to as a tag)
- Combine partial signatures using string concatenation to obtain the final signature

- コン・4回シュービン・4回シューレー

VOLE Commitments

• Homomorphic vector commitments of the form $q = u \cdot \Delta + v$

- We can make VOLE commitments non-interactive, which is referred to as VOLE-in-the-head
- ► Obtained from GGM tree vector commitments, where we make use of an (n − 1)-out-of-n commitment scheme.

▲□▶▲□▶▲□▶▲□▶ □ のQで

Scalability for Large Rings

Signatures scale sublinearly to the number of users in the ring

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

- Compressing OR statements
- Approximate Lower Bound Arguments (ALBA)
 - Make use of the uniqueness of tags

Proof-Carrying Data from Arithmetized Random Oracles

Megan Chen

Boston University

Edinburgh lightning talk September 4, 2024

Based on joint work with Alessandro Chiesa, Tom Gur, Jack O'Connor, Nicholas Spooner

A long time ago...

(in a galaxy far, far away...)

someone started a computation that continues running today.

But... how do we check that the computation is correct?

Motivation: Verifying streaming computation

Goal: check correctness of a *t*-step computation. Given: F, z_0, z_t

Verify: there exists messages z_1, \ldots, z_{t-1} such that $F(z_i) = z_{i+1}$ at each step $i \in [t]$.

Motivation: Verifying streaming computation

Goal: check correctness of a *t*-step computation. **Given**: *F*, z_0 , z_t

Verify: there exists messages $z_1, ..., z_{t-1}$ such that $F(z_i) = z_{i+1}$ at each step $i \in [t]$. Incrementally verifiable computation (IVC) [Valiant 08]: Augment each message with a proof.

Proof-carrying data (PCD) [CT10, BCCT13]: Generalize from path graph to DAG.

Applications of IVC / PCD

Verifying:

1. Long-running computations

- Verifiable delay functions [BBBF19]
- Succinct blockchains: Mina (<u>https://</u>) minaprotocol.com)
- 2. Distributed computations
 - Zero-knowledge cluster computing
 - MapReduce

Constructing IVC from SNARKS [CT10, BCCT13]

SNARK = succinct noninteractive arguments of knowledge

This work: Can we get IVC from SNARKs in the ROM?

Recursive composition:

- The SNARK prover proves that the SNARK verifier accepts.
- Problem: SNARK verifier makes oracle queries, but SNARKs prove non-oracle (circuit) computations!

Constructing IVC from SNARKS [CT10, BCCT13]

SNARK = succinct noninteractive arguments of knowledge

- [ChiesaOS20] Heuristically instantiate RO with a hash circuit.
- Downsides:
- Theory: SNARK and IVC security proofs are in different models.
- **Practical:** SNARKs of hash functions are expensive!
- [CT10, CCS22]: Defined oracle models addressing these concerns, but **no efficient** (software-only) instantiations of oracle.

Research question

Does there exist an oracle model for which: Can "accumulate"

Can "accumulate" oracle queries and batch verify

- 1. There exists IVC in this oracle
- model under standard
- (cryptographic) assumptions; and
- 2. The oracle can be heuristicallyinstantiated in software?

Our result: YES!

Contributions:

We propose the arithmetized random oracle model (AROM).

Before: Low-degree ROM [CCS22]

- Uses random low-degree polynomial structure, for accumulation and batched verification of AROM queries.
- Infeasible to (heuristically) instantiate.

 $(25 \le \text{depth}(H) \le 3000)$

Reduce depth of H with **Cook-Levin CSAT to 3CNF** reduction?

 \blacksquare Arithmetizing a hash circuit Hgate-by-gate gives a polynomial of degree > $2^{\operatorname{depth}(H)}$.

Cook-Levin is non**blackbox** in H.

The AROM

- Uses random low-degree polynomial structure, for accumulation and batched verification of AROM queries.
- Models applying non-blackbox operations to (real world) hash circuits.

See paper for details!

Contributions:

We propose the arithmetized random oracle model (AROM).

Construct transparent ZK IVC/ PCD in the AROM, assuming CRH in the standard model.

Theorem: security in the ROM implies security in the AROM.

Thanks!

Exploring the Interplay of Cryptographic Accumulators and Zero-Knowledge Proofs

Anaïs Barthoulot

University of Montpellier, LIRMM

Foundations and Applications of Zero-Knowledge Proofs 4th September 2024

(Asymmetric) Cryptographic Accumulators

Definition (simplified) ^{1 2}

- $\mathsf{Setup}(\lambda) \to \mathsf{pk}, \mathsf{sk}$
- Eval(pk, (sk,) S) $\rightarrow \mathsf{acc}_S$
- $\mathsf{WitCreate}(\mathsf{pk}, (\mathsf{sk},) \mathsf{acc}_\mathcal{S}, \mathcal{S}, s) \to \mathsf{wit}_s$
- Verify(pk, $\operatorname{acc}_{\mathcal{S}}, s, \operatorname{wit}_s$) $\rightarrow 0/1$

¹ One-way accumulators: A decentralized alternative to digital signatures, Benaloh and de Mare,EUROCRYPT 1993 ² Revisiting Cryptographic Accumulators, Additional Properties and Relations to other Primitives, Derler, Hanser, and Slamanig CT-RSA 2015

Anaïs Barthoulot

In Brief

• Lots of properties such as

In Brief

• Lots of properties such as zero-knowledge

In Brief

 Lots of properties such as *zero-knowledge* ≠ zero-knowledge proofs of knowledge

In Brief

 Lots of properties such as zero-knowledge ≠ zero-knowledge proofs of knowledge

Zero-knowledge accumulator

• Accumulated value and witnesses leak *nothing* about the underlying set, not even the size of the set

In Brief

 Lots of properties such as zero-knowledge ≠ zero-knowledge proofs of knowledge

Zero-knowledge accumulator

- Accumulated value and witnesses leak *nothing* about the underlying set, not even the size of the set
- ightarrow Not considered in this talk

Zero-knowledge accumulator

- Accumulated value and witnesses leak *nothing* about the underlying set, not even the size of the set
- ightarrow Not considered in this talk

Accumulator with zero-knowledge proofs of knowledge

• Prove membership of an element, while keeping the element hidden

Accumulators and ZK Proofs: Example of Application

Other applications: anonymous credentials, ...

Anaïs Barthoulot

Interplay of Accumulators and ZK Proofs

Interplay of Accumulators and ZK Proofs

• Efficiently Provable: combined with a commitment scheme *example:* RSA-based accumulators and Pedersen commitments³

 $^{^3}$ Dynamic Accumulators and Application to Efficient Revocation of Anonymous Credentials, Camenisch and Lysyanskaya, Crypto 2002

Interplay of Accumulators and ZK Proofs

- Efficiently Provable: combined with a commitment scheme *example:* RSA-based accumulators and Pedersen commitments³
- SNARK-friendly: verification done with (zk) SNARKs example: Merkle trees, RSA-based accumulators ⁴

 $^{^3}$ Dynamic Accumulators and Application to Efficient Revocation of Anonymous Credentials, Camenisch and Lysyanskaya, Crypto 2002

⁴Scaling Verifiable Computation Using Efficient Set Accumulators, Ozdemir, Wahby, Whitehat, Boneh, SEC 2020

Interplay of Accumulators and ZK Proofs

- Efficiently Provable: combined with a commitment scheme example: RSA-based accumulators and Pedersen commitments³
- SNARK-friendly: verification done with (zk) SNARKs example: Merkle trees, RSA-based accumulators ⁴
- Determinantal Accumulators: designed to construct special NIZK proofs ⁵

 $^{^3}$ Dynamic Accumulators and Application to Efficient Revocation of Anonymous Credentials, Camenisch and Lysyanskaya, Crypto 2002

⁴Scaling Verifiable Computation Using Efficient Set Accumulators, Ozdemir, Wahby, Whitehat, Boneh, SEC 2020

⁵Set (Non-)Membership NIZKs from Determinantal Accumulators, Lipmaa and Parisella, Latincrypt 2023

Key Takeaways

• Combining ZK Proofs and Accumulators

- Enhances privacy of accumulators
- > Applied in E-Cash, anonymous credentials, and blockchain technologies

Active Research Area

How (Not) to Simulate PLONK

https://ia.cr/2024/848

Marek Sefranek TU Wien

PLONK

- State-of-the-art zk-SNARK by Gabizon, Williamson & Ciobotaru [GWC19]
- A proof is ≈0.5 kB and can be verified in milliseconds
- Universal & updatable structured reference string (SRS)
- Knowledge sound in AGM + ROM (or just ROM [LPS24])
- Supports custom gates and lookup gates
- Deployed in a variety of real-world projects

Main Contribution

• But no proof that PLONK is zero-knowledge!

Main Contribution

- But no proof that PLONK is zero-knowledge!
- Found vulnerability in its ZK implementation & proposed fix

Main Contribution

- But no proof that PLONK is zero-knowledge!
- Found vulnerability in its ZK implementation & proposed fix

• Formal security proof that it now achieves statistical ZK

• For $Z(X) \coloneqq (X - \omega^1)(X - \omega^2) \cdots (X - \omega^n)$, want to show $Z(X) \mid C(X)$

- For $Z(X) \coloneqq (X \omega^1)(X \omega^2) \cdots (X \omega^n)$, want to show $Z(X) \mid C(X)$
- Prover commits to C(X) and quotient polynomial T(X) [KZG10]

- For $Z(X) \coloneqq (X \omega^1)(X \omega^2) \cdots (X \omega^n)$, want to show $Z(X) \mid C(X)$
- Prover commits to C(X) and quotient polynomial T(X) [KZG10]
- Its degree is **3***n*, where *n* is the number of gates

- For $Z(X) \coloneqq (X \omega^1)(X \omega^2) \cdots (X \omega^n)$, want to show $Z(X) \mid C(X)$
- Prover commits to C(X) and quotient polynomial T(X) [KZG10]
- Its degree is **3***n*, where *n* is the number of gates
- Other polynomials have degree $n \Rightarrow$ SRS has to be 3x as long

- For $Z(X) \coloneqq (X \omega^1)(X \omega^2) \cdots (X \omega^n)$, want to show $Z(X) \mid C(X)$
- Prover commits to C(X) and quotient polynomial T(X) [KZG10]
- Its degree is **3***n*, where *n* is the number of gates
- Other polynomials have degree $n \Rightarrow$ SRS has to be 3x as long
- To avoid this, PLONK splits T into 3 degree-*n* polynomials T_1 , T_2 , T_3 s.t.

 $T(X) = T_1(X) + X^n T_2(X) + X^{2n} T_3(X)$

Zero Knowledge Vulnerability

- Without splitting T(X):
 - Can be simulated as $T(\tau)$ can be computed given the KZG trapdoor τ
 - Proof independent of witness

Zero Knowledge Vulnerability

- Without splitting T(X):
 - Can be simulated as $T(\tau)$ can be computed given the KZG trapdoor τ
 - Proof independent of witness
- With the optimization:
 - T_1, T_2, T_3 leak too much information about T(X)
 - Proof no longer independent of witness!

• Randomize T_1 , T_2 , T_3 so they are uniform conditioned on satisfying $T(X) = T_1(X) + X^n T_2(X) + X^{2n} T_3(X)$

• Randomize T_1 , T_2 , T_3 so they are uniform conditioned on satisfying

 $T(X) = T_{1}(X) + r_{1} X^{n} + X^{n} (T_{2}(X) - r_{1}) + X^{2n} T_{3}(X)$

for randomly chosen $r_1 \in \mathbb{F}$

• Randomize T_1 , T_2 , T_3 so they are uniform conditioned on satisfying

 $T(X) = T_{1}(X) + r_{1}X^{n} + X^{n}(T_{2}(X) - r_{1} + r_{2}X^{n}) + X^{2n}(T_{3}(X) - r_{2})$

for randomly chosen $r_1, r_2 \in \mathbb{F}$

• Randomize T_1 , T_2 , T_3 so they are uniform conditioned on satisfying

 $T(X) = T_{1}(X) + r_{1}X^{n} + X^{n} (T_{2}(X) - r_{1} + r_{2}X^{n}) + X^{2n} (T_{3}(X) - r_{2})$

for randomly chosen $r_1, r_2 \in \mathbb{F}$

• Randomize T_1 , T_2 , T_3 so they are uniform conditioned on satisfying

 $T(X) = T_{1}(X) + r_{1}X^{n} + X^{n} (T_{2}(X) - r_{1} + r_{2}X^{n}) + X^{2n} (T_{3}(X) - r_{2})$

for randomly chosen $r_1, r_2 \in \mathbb{F}$

- Can now be simulated as the value $T(\tau)$ can be:
 - 1. Choose uniform values for $T_2(\tau)$ and $T_3(\tau)$
 - 2. Set $T_1(\tau) \coloneqq T(\tau) \tau^n T_2(\tau) \tau^{2n} T_3(\tau)$

Privacy-Preserving Blueprints via Succinctly Verifiable Computation over Additively-Homomorphically Encrypted Data

Scott Griffy¹, Markulf Kohlweiss², Anna Lysyanskaya¹, and Meghna Sengupta³

¹Brown University, ²University of Edinburgh and IOG, ³University of Edinburgh

Contributions

Compared to [KLN23]:

Definition for non-framing (auditors cannot frame users)

- Larger message space for escrows
- Logarithmic escrows (as opposed to linear) and additive-ciphertext framework

Logarithmic escrow proofs

Our paper [GKLS24] uses the Schwartz-Zippel lemma, similar to [Sha90, GKR08, Pie19, HHKP23] but applied to encryptions which requires *commitments to additively-homomorphic encryptions* (new primitive).

Polynomial which represents the watchlist: P(X). Encrypted coefficients of polynomial: $\forall i \in [n], c_i = \text{Enc}(P_i)$ Want to prove correct encryption (c_y) of P(y)

(y is the user's identity, the verifier has only a commitment to y) Naively we'd prove directly: $c_y = \prod_{i=0}^{n-1} c_i^{y^i}$

Instead, compute: $c'_{y} = \prod_{i=0}^{n/2-1} c^{y^{i}}_{i}$ $c^{*}_{y} = \prod_{i=n/2}^{n-1} c^{y^{i-n/2}}_{i}$

and prove: $c_y^\dagger = c_y' + (c_y^*)^lpha$ where lpha is a challenge from the verifier.

FDRi

- 🔀 Rejected by Council in June 20th 2024
 - Narrow minority: 63%/65% was achieved.
 - 4th different presidencies of the EU council (Belgium) failed to reach a compromise
 - Proposed changes included optional "upload moderation": opt-out from E2EE scanning => no media sharing
- A Now revived by Hungary presidency with minimal changes
- If a majority is reached on the council, Trilogue negotiations will begin

What does the proposed law mandate

- Mandatory scanning of all messages for known or suspected** CSAM
 - All commercial communication services in scope, regardless of size, location, or e2ee usage*
 - \circ Not targeted to specific suspects*
 - Matches automatically reported to the police
 - Military and intelligence services' accounts are excluded (conjecture: politicians too?)
- "High risk" services require mandatory age controls (no user under 16 allowed)
- Mandatory detection of grooming behaviour**
- ISPs required to block access to illicit content*
- Creates Centre on Child Sexual Abuse as single point of contact for reporting

Motivation for Client-side Scanning

- Chat control-specific motivation: CSAM & grooming
- For CSS generally, EU included terrorism and organized crime as reasons.
 - Protecting the privacy and security of communications through encryption and at the same time upholding the possibility for competent authorities ...to lawfully access relevant data ... for fighting organized crimes and terrorism... are extremely important.

 $Council \, Resolution \, on \, Encryption \, - \, Security \, through \, encryption \, and \, security \, despite \, encryption \, (13084/1/20)$

• Implicit / connected motivations:

- Preventing / stopping "unwanted" political protests
- Drug trade
- Money Laundering, Fraud / Scams
- Preventing hate crimes and harassment
- Lobbying...

Motivation for Client-side Scanning

Against Chat Control & CSS

- Technical arguments
 - Soundness: no CSS method is working well. Evasion attacks.
 - Privacy: leaking models to client, revealing non-targeted content.
 - Security: false positive attacks, targeting people, larger attack surface.

EDRI Position Paper

(best 3 page summary)

https://edri.org/wp-content/uploads/2022/ 10/EDRi-Position-Paper-CSAR-short.pdf

- Gives more power not only to authorised (gov), but also unauthorised (foreign govs), <u>10/E</u>
 local (family abuse) advs.
- Legal/political arguments
 - Likely to be struck down by ECHR as incompatible with other European laws.
 - "The legislative proposal fails to meet the key human rights principles of necessity and proportionality, violates several fundamental rights, and lacks a sufficient legal basis."
 - Backsliding risks, discrimination/fairness (CSS & age verification), code origin/server origin/more power to companies.
 - \circ $\$ Legitimate users are put are risk, including the population the law is trying to protect

What can we do?

Scroll till this part 🔃

Take action now

These are ideas for what you can do in the short-term or with some preparation. **Start with**:

- Ask you government to call on the European Commission to withdraw the chat control proposal. Point them to a joint letter that was recently sent by children's rights and digital rights groups from across Europe. Click here to find the letter and more information.
- Check your government's position (see above) and, if they voted in favour or abstained, ask them to explain why. **Tell them that as a citizen you want them to reject the proposal**, that chat control is widely criticised by experts and that none of the proposals tabled in the Council of the EU so far are acceptable. Ask them to protect the privacy of your communication and your IT security.
- · Share this call to action online.

When reaching out to your government, the ministries of the interior (in the lead) of justice and of digitisation/telecommunications/economy are your best bet. You can additionally contact the **permanent representation of your country with the EU**.

Pressure on the negotiators + media attention + *harm reduction if law passes*

https://www.patrick-breyer.de/en/take-action-to-stop-chat-control-now/
Communities and Organisations

- We need forums for political action related to digital privacy...
 - Among cryptographers and other researchers

Are we going to wait for crypto's Manhattan project?

- Interacting with policy-makers and general public
- Orgs to join / support financially:
 - EDRI: <u>edri.org</u>
 - Open Rights Group (UK): <u>openrightsgroup.org</u>

The Moral Character of Cryptographic Work*

Phillip Rogaway

Department of Computer Science University of California, Davis, USA rogaway@cs.ucdavis.edu

> December 2015 (minor revisions March 2016)

Abstract. Cryptography rearranges power: it configures who can do what, from what. This makes cryptography an inherently *political* tool, and it confers on the field an intrinsically *moral* dimension. The Snowden revelations motivate a reassessment of the political and moral positioning of cryptography. They lead one to ask if our inability to effectively address mass surveillance constitutes a failure of our field. I believe that it does. I call for a community-wide effort to develop more effective means to resist mass surveillance. I plead for a reinvention of our disciplinary culture to attend not only to puzzles and math, but, also, to the societal implications of our work.

Keywords: cryptography \cdot ethics \cdot mass surveillance \cdot privacy \cdot Snowden \cdot social responsibility

https://web.cs.ucdavis.edu/~rogaway/papers/moral-fn.pdf
